Application/Control Number: 07/702,463

Art Unit: 3662

- 1. In view of the Rescind Order and the subsequent updating of the application search, the instant application is hereby re-opened in view of the newly cited prior art to Lewin et al (GB 2,165,396) and Smith et al (IEEE "A UHF Buoyant Antenna").
- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-4 and 6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lewin et al in view of Smith et al.
- 4. Lewin et al disclose a sea surface (buoyant) antenna comprising a tube of copper clad polythene forming a slot 10 shorted at each end 12 (1:47-54). Tuning is obtained by the use of one or more varactor diodes 13 (1:57-58) distributed along the slot 10 length (1:116-120) and at substantially equal intervals along its length (5:64-67). The actual control of the varactors involves a small modulation signal on the varactor bias (1:63-85) and thus is variable. Figure 5 shows the decrease in size attributed to the variable tuning provided to the buoyant antenna. Lewin et al also disclose that the choice of a resonant length L equal to half the free-space wavelength is not mandatory and thus provide a suggestion of using other design choices regarding the length of the antenna. Lewin et al differ from the claimed subject matter since the slot is not specified as being coupled to a feed circuit at its midpoint.
- 5. Smith et al ("A UHF Buoyant Antenna"), cited in the applicants' specification shows a practical design in Figure 1(b) for a buoyant antenna having a slot along the length of a metallic tube wherein the slot is fed at about its mid-point to a feed circuit and the slot is bridged by a plurality of varactors so as to tune the antenna by varying the capacitance. As Smith et al is directed to a similarly designed buoyant antenna having a longitudinal slot, the choice of a feed design incorporating a center-fed slot would have been an obvious design modification to couple the feed signals to the slot in a conventional and practical manner. Moreover, the design limitations regarding the slot length and antenna diameter are met by

Art Unit: 3662

various design embodiments included in Lewin et al, for example, L= 1.2 m, a= 2 cm and f=(242 MHz-490 MHz).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Gregory C. Issing whose telephone number is (571)-272-6973. The examiner can normally be reached on Monday - Thursday 6:00 AM- 4:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor,
Thomas Tarcza can be reached on (571)-272-6979. The fax phone number for the organization where
this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
